Taking the guesswork out of the *agentic SDLC.*

Grove is a Software Engineering Workbench. Design the system, set the standard each task has to meet, run agents under your rules, and review the work before you merge it. Time spent in the design means the build has less to guess.

SOFTWARE ENGINEERING WORKBENCH

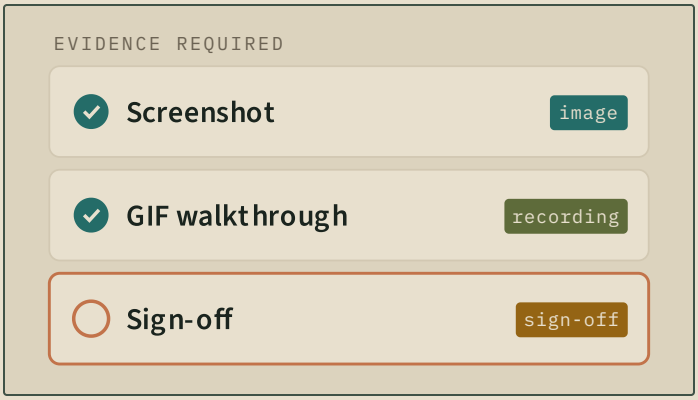

- Design
- Set the standard
- Run agents
- Review

Each type lists its fields and relations.

1 A design to build from

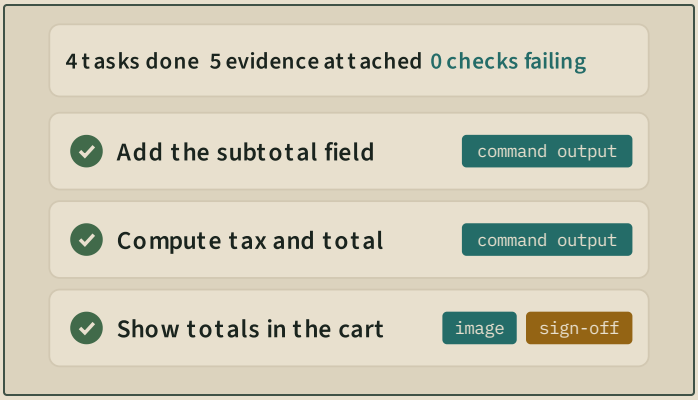

Catch design mistakes while they cost a conversation, not a rewrite. Ask the design what a change will touch. Walk stakeholders through the app before it exists.

The task stays open until someone checks Sign-off.

2 Done means demonstrated

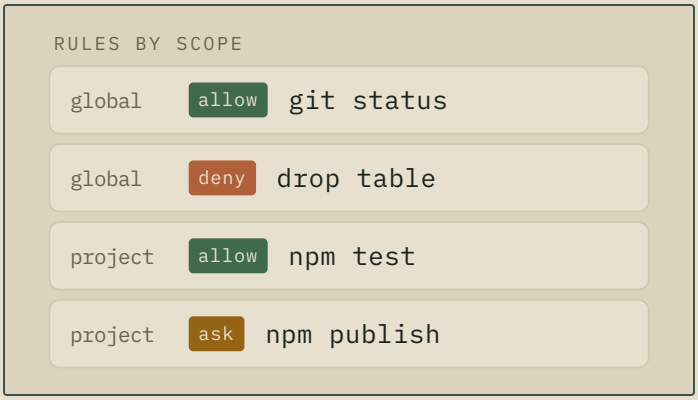

A task isn't done until the agent shows it works, with screenshots, recordings or passing tests. Where it matters, you sign off. Nothing ships on the agent's word.

Each finished task sits beside the evidence attached to it.

3 Easy review and feedback

Provide UI review directly in the browser. Get an executive summary of every finished task, with screenshots and recordings.

Rules by scope allow, ask or deny a command.

4 Boundaries

Define what agents can and can't do. When one tries something it shouldn't, tell it what to do instead.
